Spring Lecture Meeting at NYMS in Clifton, N.J. – Saturday, May 21st, 2016 at 2PM
Doors open at Noon.

John Scott will present a general introduction and overview of the microscopical method MicroFade Testing, also known as microfadeometry, or MFT.

Invented almost twenty two years ago, MFT couples accelerated aging with spectroscopy, in microfadeometric instrumental systems which enable investigating light sensitivity of specific objects of concern by microspectrometrically monitoring tiny surface areas of specific objects while they are subjected to intense and minutely focused light. Light-induced accelerated aging and vibrational spectroscopy are well known and widely used to study alteration in materials, not only in general materials research and development, but also in the study and care of physical cultural heritage. Microfadeometric direct investigation and evaluation of materials alteration has been moderately well researched, research continues, and microfadeometry is already used rather widely in cultural heritage studies and management. A major application is in evaluating and tailoring exhibition conditions for light sensitive artworks.

This coming November 15-16, 2016, MFT will be the main topic of the New York Conservation Foundation's 2016 (22nd) Conservation Science Annual symposium at the Eastern Analytical Symposium in Somerset, NJ. An international roster of twelve first rate conservation scientists and analysts will present on early, current and developing MFT theory, research, instruments, applications and experience, and on critical evaluation and assessment of MFT, and on prospects for the future. Registration at early-discount rates closes October 15:

http://easinc.org/wordpress/?page_id=451

Most of the speakers roster for our 2016 NYCF Conservation Science Annual at EAS is already set, but contributed abstracts for talks and posters on current MFT experience are welcome through May 16 via:

http://easinc.org/wordpress/?page_id=3083

The New York Conservation Foundation may offer by subscription an expert-led hands-on microfadeometry workshop in New York City, scheduled immediately following the November CSA symposium. Contact NYconsnFdn@aol.com for news of that workshop.

Dues and Addresses
Please remember to mail in your Dues to:
Mel Pollinger
Treasurer, NYMS
18-04 Hillery St.
Fair Lawn, NJ  07410-5207

Junior (under age 18) $10
Annually
Regular $30
Student (age 18 or above) $20
Annually
Supporting $60 Annually
Corporate (includes one advertisement in NYMS News) $175 Annually
Life $300 (payable within the year)
To avoid missing notices:
Notify Mel Pollinger if you have changed your address, phone or email.

The Mission of the New York Microscopical Society is the promotion of theoretical and applied microscopy and the promotion of education and interest in all phases of microscopy.

Alternate Meeting Notifications
Please note that due to time constraints in publishing, some meeting notices may be available by calling Mel Pollinger at 201-791-9826, or emailing: pollingmel@optonline.net

Awards Given by the New York Microscopical Society
The New York microscopical Society takes great pleasure in recognizing and rewarding individuals who have contributed to either the activities of the society or to furthering microscopy. These awards are described in our website and in a pdf file for our email newsletter recipients. All members are eligible to nominate individuals for these various awards, and are encouraged to do so. John A. Reffner, Awards Committee Chairperson

Awards Committee
Chair: John A. Reffner
Members
Jan Hinsch
Peter Diaczuk
Angela Klaus
John R. Reffner

To Order Your NYMS Lapel Pins
Send a check in the amount of $12.00 per pin to:
New York Microscopical Society
C/O Mel Pollinger, 18-04 Hillery Street, Fair Lawn, NJ 07410. To avoid shipping & handling charges, pins may be purchased directly at any NYMS meeting for $10.00.

Micropia wins prize for most innovative and groundbreaking museum of Europe -  
Jury praises uniqueness and originality of world’s only microbe museum – April 10, 2016

Yesterday evening, Micropia was awarded for most innovative museum by European Museum of the Year Award (EMYA). The ceremony took place in San Sebastián, Spain. From among 49 nominees, Micropia was selected for the highest recognition, the Kenneth Hudson Award. The judges about Micropia: “It’s an unique and original museum presenting, in an elegant and engaging exhibition, the world of microbial life. The museum excels for high design value, effective management, and partnerships, charismatic leadership, and groundbreaking developments in display and communication.”

Microscope Day by NYMS & John Jay on 21-April-2016 was another exciting journey into forensic education as presented by speakers Dr. Jack Hietpas; FBI ORISE, Detective Greg DiCostanzo; NYPD Forensic Investigation Division, Adam Hartley; Forensic Evidence, Inc., Dr. Jennifer Rosati; University of Windsor, Ontario & John Jay College, and Cindy Vitali; Senior Forensic Chemist, DEA Northeast Laboratory. Speaker awards were presented by Dr. Peter Diaczuk of NYMS & John Jay College.
Visitors Always Welcome to NYMS

Although most of our lecture meetings, workshops and classes are held in the NYMS Clifton facility on the last Sunday of the month, the building may be opened for special purposes at other times, by appointment only. For such an appointment, please contact Mel Pollinger by phone at (201) 791-9826, M-F noon to 9:30pm, or by email at pollingmel@optonline.net.

From The Editor...

if you have an email address: Getting the newsletter by email means you can receive an extended pdf version that cannot be sent by “snail mail.” Even if you only continue your USPS delivery of the newsletter, NYMS needs your email address for reporting priority events and special news. Being able to contact you quickly by email means better communication between you & NYMS■■ Mel

Need to use a Microscope?

The various microscopes that are presently set up on the main floor of the New York Microscopical Society building in Clifton, N.J. are there for the use of its members.

Check out The Secret World Inside You at the American Museum of Natural History open till August 14, 2016!

Microscope Cleaning Kit

A complete set of tools and accessories to keep your microscope in optimum operating condition. The kit is put together by our previous Curator/Educational Chairman, Don O’Leary, and available directly from NYMS, while they last, for only $40.00 plus shipping & handling, or may be purchased at a meeting. Call or email Mel Pollinger for details (see page two for contact numbers).

NYMS Meeting Dates

Most lecture meetings of NYMS are usually held in Clifton on the last Sunday of the months of Jan., Feb., Mar., May, Sep., Oct. Exceptions will be noted in the Newsletter.

NYMS microscope slide collections are available for study at meetings and by appointment.

Please be aware that our website is continuously updated.

Attention NYMS Members

Got something to sell? Article to publish? Pictures for the newsletter? Looking to buy something? Want to use the library? Want to use a NYMS microscope? For any of the above, contact the Editor, Mel Pollinger.

Answer to Mystery Photo for Apr 2016

Cigarette smoke deposit, 100x, D.I.C. Photomicrograph by Eric Gravé. Did you guess correctly?

Email Newsletter recipients can also receive copies of NYMS Newsletter pdf back-Issues from 2007. Copies of older newsletters will be included in the supplement section as I convert them.
The 1860s Smith, Beck & Beck Transparent Injections

HOWARD LYNK

Introduction

During the early 1860s, a series of histology slides was introduced by Smith, Beck & Beck [Beck]: the superb transparent tissue injections were rumoured to be made in Germany [1]. Their bluish-tinted glass is their distinctive attribute, mostly size 1½x3in (38x76mm) (Figs. 1, 4). All carry excess of balsam round their covers, are never papered, and carry only simple printed pale-green labels: these look like other Beck slide labels of the time, but lack the firm’s name or address (Fig. 2).

The mounts were prepared using the recently-introduced technique of injecting fine blood vessels with transparent stains such as carmine, for transmitted light: they met with immediate acclaim.

This paper examines the early history of these slides, the technical advances that made them possible, and suggests their actual maker.

Introduction of the slides

Beck began showing the mounts sometime during 1860, often using their latest microscopes, to groups of London medical men. The first reference to this so far to hand was at a conversazione on the evening of 30 October 1860, at the opening of the 5th Annual Session of the Members of the College of Dentists. A report in the College of Dentists of England ~ Transactions, 1860, specifically mentioned them [2]:

At the opposite part of the room was a large display of microscopes, contributed by Messrs. Smith and Beck, Mr. Ladd of Beak street, and Mr. Pilscher of Bond street. It is unnecessary that we should refer to the beauty and accuracy of the instruments of these well known makers. We cannot, however, help calling attention to a series of injections of the teeth and other structures, by Messrs. Smith and Beck. The peculiarity of these specimens consists in their being transparent; so that, instead of the objects being viewed by reflected light, as is the case with the ordinary injections, they are mounted as transparent objects, and can be submitted to the highest power of the microscope.

The 19 January 1861 edition of The Athenaeum [3] included Beck’s advertisement:

In the endeavour to make our Collection of Prepared Specimens complete in every branch, we have lately secured the sole agency for the sale of some most remarkable transparent injections.

Similar advertisements continued to appear regularly in later editions over the coming months.
Fig. 1. Examples of the German transparent injections from Smith, Beck & Beck
Introduced and sold during the early 1860s. These preparations were often marked with INJ., denoting “injected”, but just as frequently have no such designation printed on their labels.
With the publication of a very favourable review in the April 1861 edition of *The Quarterly Journal of Microscopical Science* [4], continued interest in the slides was assured. At the beginning of their report the editors, Edwin Lankester and George Busk, said:

*Messrs. Smith and Beck having sent us up a selection from the transparent injected preparations which they now have on sale, we feel we should be doing a service to our readers by calling attention to them. We believe these preparations are not made in this country; but from whatever part of the world they are obtained, they claim the merit of being the most successfully mounted microscopic preparations that have yet been offered to the public for sale.*

Throughout the three-page review of the slides their enthusiasm is obvious. In the commentary on the preparations of *The Nervous System*, they observe:

*... in these preparations the principle part of the structure elucidated is the distribution of the smaller blood vessels. It is, in fact, in the extraordinary delicacy of the injections that one of the great merits of these preparations exists. (Fig. 3)*

In describing the preparations of the *The Eye*:

*The whole series devoted to the eye are exceedingly delicate and beautiful,*

and concerning the preparations of *Organs of Respiration* they continue:

*The lungs afford a very fine opportunity to the maker of these preparations, and in the perfection of the injection of the vascular network in the air-cells we have seen no better illustration than these.*

The report concludes:

*Here in these few slides we have a perfect museum of histological structures, and the student with these in hand and his microscope can form a better idea of the nature of an organ, and the functions it possesses, than if he spent years amongst preparations in spirits.*

The editors offered Beck several suggestions. These included having the mounts made up using standard 3x1in glass slides, and printing the specimen details on the labels in English rather than in Latin. On the evidence of surviving mounts, this latter suggestion was adopted almost immediately, but oversized slides continued to be used for some years. There is mention of the “clumsy size” of the slides in the literature, with remedies suggested from total remounting to trimming down using a diamond and board [5] (Fig. 5F). Eventually Beck did begin to provide these preparations on the standard 3x1in slips (Figs. 5B-E), although the date of that introduction has not been determined.

Also in April 1861, a report on the meeting of the Manchester Literary and Philosophical Society on the 15th enthused [6]:

3 Originally published in the Winter 2012 Quekett Journal of Microscopy, Issue 41, pages 701-712
Republished with permission in Micscape Magazine, March 2016
www.micscape.org
Fig. 2. Label variations of Smith, Beck & Beck slides
introduced and sold from the later 1850s through the 1860s. Even though the company’s name
and address varied, the style of their pale-green labels remained largely unchanged.

Figs. 3A, 3B. Microphotographs of the fine injected vessels
made visible by the use of transparent injection techniques (in both cases using
transparent carmine). [Fig. 1 shows the gross slides: 3A is taken from the preparation of
“Cat Tongue”, 3B is of the “Human Cerebellum”].
Mr. Beck, of London, exhibited two of his binocular microscopes on Mr. Wenham’s principle; also a great variety of first class objects. The members were struck with the advantages of the binocular system for low and medium powers, and the manner in which it presents in full relief the various parts of objects. They were also pleased with the beauty of certain injected preparations – as the eyes of small animals, sections of tongues (Fig. 3A), etc.; the binocular displaying the variety of structure and the smallest blood vessels filled with a bright red, and transparent injected substance – in situ – distinctly to be traced one above another, instead of appearing, as with the single microscope, a tangled mass all in the same plane. These instruments and objects strongly mark the rapid advance microscopy is making at the present day.

Beginning in June 1861, a new series of advertisements was begun. In the June 22 edition of The Lancet [7], a stand-alone advertisement now simply states:

*Transparent Injections ~ Smith, Beck & Beck have just received a new series of these beautiful preparations. Catalogue forwarded, post free, on application. 6 Coleman street, London, E.C.*

The fact that no further explanation was necessary is noteworthy. Similar advertisements were soon appearing in The Athenæum as well. The edition of 21 December 1861 [8] carried the prominently-displayed:

*Transparent Injected Preparations ~ Smith, Beck & Beck, 6 Coleman street, London, EC. have just received another large assortment of these beautiful objects for the Microscope. Collections for selection sent into the country on receipt of a satisfactory town reference and paying carriage both ways. A Catalogue sent post free on application.*

The 25 January 1862 edition of The Lancet provided further information: its Medical News column [9] reported on the recent University College soiree:

*Messrs. Smith and Beck exhibited some new forms of microscopes, specially adapted for the examination of the fine transparent injections which are now being made by a distinguished German professor of surgery.*

The brief reference to the maker of the slides is a pointer towards the identity of their actual mounter.

On 1 May 1862 the International Exhibition of 1862 opened in South Kensington, London. Beck, long one of the premier microscope and scientific instrument makers, provided a prominent display at the Exhibition. They were entered in Class 13 (Philosophical Instruments, and Processes Depending On Their Use) as exhibitor 2964, housed in Gallery, North Court [10]. Their presentation area was briefly described in The Companion to the Official Catalogue. [11]:

 Originally published in the Winter 2012 Quekett Journal of Microscopy, Issue 41, pages 701-712
 Republished with permission in Micscape Magazine, March 2016
 www.micscape.org
Messrs. Smith, Beck & Beck, whose case faces the top of the stairs, have a very extensive display of binocular and single microscopes, telescopes, object glasses, and stereoscopes; also microscopic objects and cabinets, also a museum microscope for public exhibition, with 504 objects so attached as any of them can be seen under these magnifying powers.

A detailed report on the 1862 Exhibition written by Mr. C. Brookes, is more informative [12]: in his general comments he specifically mentioned some of the microscopic objects shown by Beck:

There is a very creditable display of preparations, both British and foreign; but it is to be regretted that one, who has for many years been considered the first British preparer, has contributed nothing to this Exhibition. The German objects prepared by imbibition and transparent injection, imported and exhibited by Messrs. Smith, Beck & Beck, are extremely beautiful and instructive.

This brief mention of the techniques used in their preparation is interesting, for the term “imbibition” may point to the meaning of “IMB” printed on some of the Beck labels (Figs. 4A-F): we shall return to this point below. Brookes’ curious statement about “the first British preparer” may refer to C. M. Topping, already entered as an exhibitor, but then conspicuously absent from the actual displays [13].

By the last day of the International Exhibition, on 1 November 1862, well over six million visitors had attended [14]: many would have had the opportunity to examine Beck’s displays. After the Exhibition, Beck resumed their programme of public demonstrations. For example, a December 1862 report of the 2nd Annual Soiree of the Southampton Microscopical Society [15]:

Messrs Smith and Beck exhibited several binocular microscopes, their beautiful transparent injections, especially one of the brain, being a source of great attraction. (Fig. 3B).

In the following year a very early advertisement from Edmund Wheeler, in the 1 May 1863 edition of The British Friend [16] included:

N.B. ~ E. Wheeler supplies Microscopes, Optical Instruments, Etc., by the distinguished firm of Smith, Beck & Beck, at their prices. Also their beautiful German Anatomical Injections, Achromatic Stereoscopes, Photographs of the Moon, etc. (Fig. 6)

A Wheeler preparation (Eye of Cat) has the front labels clearly written in Wheeler’s hand, and his note on the bottom label “See over”, points to the Beck label on the rear (Fig. 5A). It is not clear if this kind of arrangement was unique to Wheeler, but such an arrangement would surely have enhanced Beck’s sales.

However, after 1863 only an occasional mention of Beck’s German preparations occurs, and their exhibitions possibly came to an end around 1865, but whether this was connected to the retirement of James Smith in 1864 is not known. Nor has it been
Figs. 4A, 4B, 4C, 4D.  **Four examples of the German anatomical specimens**
prepared using differential carmine staining.
These preparations seem to be much less common than those prepared using transparent
injection, and have an IMB. printed on their labels.

4E A scarce variation with the label indicating that both imbibition (IMB.) and transparent
injection (INJ.) techniques were used in the preparation.

4F An unusual pathology specimen, prepared by imbibition (IMB.), and specifically
relating to the study of epithelial cancers.

4G Fine example of transparent injection of Rabbit Liver, with 4 different transparent
colors used to differentiate the structures.

4H Occasionally, one sees an unlabeled example with the specimen description hand
written in black ink. It is also not uncommon to see examples of fully labeled slides, with a
portion of the handwritten description still visible (often in the same hand and ink) under
an over-layering of original mountant, as seen in

4I. This would suggest that the slides probably all originally carried the handwritten
descriptions during their preparation, and were then cleaned prior to application of the
Smith, Beck & Beck paper labels.

4J An interesting enhancement to a spectacular transparent injection of Cat Cerebrum: a
frame of thin mahogany wood with an oval cutout has been bonded to the front of the full
size slide surface, and the label relocated.
possible to determine when their “sole agent” agreement with the German maker ended, although they seem to have continued sales of the slides for some years. Certainly, by the mid-1860s there were also other mounters selling transparent injections [17, 18], so any exclusive sales agreement might not have been so important.

Special attention is requested to the transparent injections, which are prepared expressly for me by a foreign (German) gentleman, which for their superiority cannot be equalled.

Additionally, under the heading TRANSPARENT INJECTED PREPARATIONS, is a further interesting note:

Specially prepared for M. Pillischer by a celebrated German Professor, and pronounced by the Medical Profession as the best ever seen.

It seems reasonable to think that this “celebrated German Professor” may be the same as the “distinguished German professor of surgery” who had originally provided these mounts to Beck in 1860.

**IMB and INJ**

Ten years after having acquired a few of these mounts, a chance inquiry from another collector asked about the meaning of the designation “IMB” printed on some of the slides (Figs. 4A-F). Most of the Beck preparations are marked “INJ” (more obviously indicating “injected”), or are unmarked (Fig. 1). “IMB” might perhaps stand for “imbued”, a term occasionally used in biology for “stained” or “coloured”, but it was usually thought to mean “imbedded”. I decided to revisit this question.

In the 5 June 1858 edition of The Lancet is a report of a presentation to the Royal Medical and Chirurgical Society on 8 December 1857, on the histology of the supra-renal capsules by George Harley of University College, London [20], which included:

_The simplest and most beautiful mode of demonstrating the existence of a nucleus, is by colouring the cells with carmine. As this process of “imbibition”, as it is called, is quite new in England, indeed in any country, it being scarcely a year since it was employed for the first time in Germany, I may briefly describe it. “Imbibition” might be termed a process of natural injection. The principle upon which it is founded exists in the fact, that different animal tissues absorb and retain pigments with various degrees of avidity._

The paper goes on to describe the carmine imbibition process in some detail, the description of the resulting stained specimens matching well with those Beck slides marked “IMB”. The slides in my own collection confirmed that all bearing the “IMB” designation did seem to be carmine stained (Figs. 4A-F). Of course, the Brookes report on the 1862 Exhibition specifically mentions:
The German objects prepared by imbibition and transparent injection, imported and exhibited by Messrs. Smith, Beck & Beck, are extremely beautiful and instructive.

It is now clear that “imbibition” was an early term synonymous with (carmine) staining.

In addition to the examples designated “INJ” or “IMB”, many of the slides carry no such designation on the labels (Fig. 1): this applies to over half of the nearly 50 examples in my own collection. All the examples prepared using carmine imbibition are clearly marked “IMB” on the labels. Some examples are marked both “IMB” and “INJ” on the same label (Fig. 4E), and were prepared using both carmine imbibition and transparent injection. All of my unmarked examples were found to be transparent injections.

One of the earliest explanations of transparent injection methods is found in Lecture VII given by Beale during the winter of 1856, and published in 1857 [21]. The method is based on injection of vascular tissue structures using extremely fine-grained coloring matter (at the time, primarily Prussian blue and carmine), dissolved or suspended in a gelatine solution or glycerin. A brief mention of the technique is also noted in Ure’s 1839 Dictionary [22], under “isinglass”:

*A solution of isinglass coloured with carmine forms an excellent injection liquor to the anatomist.*

This early mention of a carmine-based injection fluid is noteworthy, suggesting that it was a method already in use for some period prior to 1839.

This is in marked contrast to many of the surviving slides produced by injection during the 1840s and 1850s. The injected slides commercially produced during that period are almost invariably opaque injections prepared using vermilion (Chinese red) or chromate of lead (chrome yellow) pigments [23], although other coloured pigments were occasionally used (Fig. 5G-M). These mounts required use of reflected light for study, and provided limited useful information. The opaque injected tissues were usually presented on slides in fluid-filled deep cells, or as thick sections mounted in Canada balsam. Variations of these types of mounts were made famous by early professional slide makers such as C. M. Topping and Alexander Hett (Figs. 5G-K). In fact, both Topping and Hett won awards at the The Great Exhibition of 1851 for their preparations of opaque injected histology specimens [24, 25].

Although the majority of commercially prepared injected mounts in the early 1850s were still being made using various opaque colours, it is clear there was a growing interest in the use of transparent colours. Perhaps one of the difficulties preventing a wider use of carmine for this purpose, was the tendency of the colour to “bleed” through thin vessel walls, thus ruining the specimen [23, 26]. It may have been the examination of such unintentional accidents that gave rise to the recognition of the potential use of carmine as a differential nuclear stain (imbibition) [26]. In any event, extensive
Fig. 5A This interesting slide appears to be evidence of the relationship between the firms of Edmund Wheeler and Smith, Beck & Beck. While wrapped in Wheeler’s distinctive cover papers and labeled in his hand on the front, it carries the unmistakable label of a Smith, Beck & Beck German import on the underside.

5B – 5E Four examples of the imported German transparent injections, all mounted on standard 1” x 3” sized glass slides. Although it is obvious that a transition from the original larger 1 ½” x 3” size eventually took place, that date is not known with any certainty.

5F One owner’s answer to the somewhat inconvenient size of the imported German histology slides originally offered by Smith, Beck & Beck: the slide has been cut down (apparently using a “heavy” hand!) to something approximating the standard 1” x 3”.

5G – 5I Three classic examples of the celebrated opaque injections by C.M. Topping, late 1840s through the 1850s, all prepared using chromate of lead (yellow) pigment.

5J and 5K Two examples of opaque injections by A. Hett, one signed and dated 1849, and the other 1850. Hett primarily used vermilion (red) pigment for his injections.

5L A fine opaque injection by J.T. Norman c. 1850s, unusual in that a white pigment was used for injection of the veins.

5M Excellent three color opaque injection of Human Liver by H. Webb, mid to late 1850s. Red, yellow, and blue pigments were used to display and contrast the structures.
experimentation was being conducted throughout the 1850s into the development and refinement of various stains and techniques, with much of that activity taking place in Germany [27]. By the later 1850s, various means of preparing carmine for use in transparent injections had been developed. Much of that work was accomplished by Professors Joseph Gerlach and Carl (or Karl) Thiersch of the University of Erlangen [26, 28], and allowed carmine to be used successfully as an excellent transparent red colouring component without the prior problems associated with unwanted colour diffusion.

It is apparent that the series of anatomical preparations that were imported from Germany and sold by Smith, Beck & Beck used the advances of the later 1850s. One only needs to recall the comment by Messrs. Lankester and Busk concerning the preparations, to appreciate their significance: ... they claim the merit of being the most successfully mounted microscopic preparations that have yet been offered to the public for sale.

**Who made these Beck German imports?**

My work on the “IMB” designation uncovered a number of other details, which were of interest in regards to the entire range of imported German anatomical slides sold by Beck in the early 1860s. Like most of the firms reselling preparations, Beck kept secret the identities of their suppliers. Since they used printed labels for their slides, identification of the preparer based on handwriting is not an option.

It was likely this German professor of surgery would have been well known for work with transparent injections and carmine staining during the 1850s. A brief mention in Kolliker’s 1854 edition of *Manual of Human Microscopical Anatomy* took on a new significance:

*With respect to the vessels of the foetal eye, Dr. Thiersch has quite recently communicated to me a mass of interesting details, accompanied by beautiful injections* [29].

As has been previously mentioned, Thiersch, along with Gerlach, contributed greatly to the advances made in carmine staining and injecting during the 1850s. Thiersch was also a distinguished German professor of surgery. By the early 1860s he was a highly respected surgeon with an international reputation [30, 31]. Further, some evidence of contact between Beck and Thiersch emerged. A report of the activities at “The Last Congress of German Naturalists and Physicians”, held in Speyer, Germany during October of that year, appeared in the 7 December 1861 edition of the *Medical Times & Gazette* [32]. The report included:

*Professor Thiersch then gave a most interesting account of epithelial tumors... The same gentleman exhibited nearly 100 microscopical preparations (Fig. 4F), which confirmed his*
views, and the injection of which excited general admiration. This Surgeon uses a stereoscopic binocular microscope, as manufactured by Smith, Beck & Beck, of London, and which is, no doubt, one of the best ever made.

A review of the Smith, Beck & Beck Delivery Books [33] confirmed the sale of a binocular microscope, type “B.P.S.” serial 2695 to Professor Thiersch, in June 1861.

A “Notice of Donation to the Medical Museums” at Queens College, Belfast is noteworthy [34]:

A beautiful series of microscopical preparations, showing the texture of many organs of the body, was presented by Dr. Thiersch, of Leipzig, to Dr. Redfern, Professor of Anatomy, and by him generously handed over to the college.

Unfortunately the actual date of that donation was not noted. Another similar bequest of Thiersch’s transparent injections, made long after their actual preparation, was recorded in the The Harvard Graduates Magazine, 1896-97 [35]:

The President reported that Mr. Bernard S. Oppenheimer had given to the Zoological Department a collection of 136 preparations of transparent injections of the vascular system of various organs and parts of organs of vertebrates, prepared by the late Professor C. Thiersch of Leipzig, Germany.

Communication with archivists at the Harvard University Museum of Comparative Zoology (the modern repository of the old Zoology Department collections) brought the unfortunate news that this group of Thiersch’s transparent injections had evidently long ago disappeared from their inventory and collections, as no record or evidence of them could be located.

In addition to using carmine red and Prussian blue, Thiersch developed other colours for use as well. In Stricker’s 1870 Manual of Human and Comparative Histology [36], we find:

The colouring matters usually employed are Prussian blue and carmine… Thiersch, whose transparent injections are perfect models of the art, also uses a transparent green and yellow.

One of the slides from Beck shown in the accompanying illustrations (the preparation of “Rabbit, Liver”) is just such a four-colour injection (Fig. 4G). Beale, in his 1868 edition of How to Use the Microscope [37], also described Thiersch’s development of injection colors other than red and blue, mentioning yellow, green, and a lilac variation of carmine. Other interesting references were found describing “Thiersch’s Shellac” or “Thiersch’s Varnish” and its use [38]:

When the specimens have been mounted for several days, weeks, or even months in pure Canada balsam, or a solution of the same in chloroform, they are then surrounded with a border of Canada balsam in chloroform… later, but never before the second or third day, still better after weeks or months ~ a final coating is to be applied.
EDMUND WHEELER,
MANUFACTURER OF ACHROMATIC OBJECTIVES,
MICROSCOPES, AND TELESCOPES,
48 TOLLINGTON ROAD, HOLLOWAY, LONDON, N.,
HAVING devoted many years to the production of Optical Instruments of First Class quality, and at the lowest remunerative price, he now solicits the favour of his friends requiring MICROSCOPES, TELESCOPES, or METEOROLOGICAL INSTRUMENTS—gives them the assurance that his representations are worthy of their confidence, and invites an inspection of his
ACHROMATIC MICROSCOPES, combining Binoculars and other Attachments and Improvements.
The OBJECT GLASSES made by R. W. Wheeler are excellently in quality by any.
100 MICROSCOPES, from every Department of Nature, Selects sent for choice.
ASTRONOMICAL TELESCOPES, guaranteed the best that can be produced.
TELESCOPES for TOURISTS, SEA-SIDE, and GENERAL USE, remarkable for their Lightness and perfect definition.
FIRST CLASS BINOCULAR OPERA, FIELD, and MARINE GLASSES.
STANDARD BAROMETERS, THERMOMETERS, and all apparatus in Practical Meteorology.
R. W. WHEELER'S POCKET MOUNTAIN AMBOY BAROMETER.
DEScriptive PRICED CATALOGUES, POST FREE.
N. R. - R. WHEELER supplied Microscopes, Optical Instruments, &c. by the Distinguished Sons of W. B. & B. & B., as their prices. Also, their beautiful German Anatomical Injections, Achromatic Microscopes, Photographs of the Moon, &c.

Originally published in the Winter 2012 Quekett Journal of Microscopy, Issue 41, pages 701-712
Republished with permission in Micscape Magazine, March 2016
www.micscape.org

Fig. 6. An interesting early advertisement from Edmund Wheeler (1863) illustrates a business relationship with Smith, Beck & Beck, specifically noting their “beautiful German Anatomical Injections”. Also of interest, is Wheeler’s claim to have an inventory of “10,000 Microscopic Objects, from every department of Nature”.

Fig. 7. A portrait of Prof. Thiersch and his obituary which appeared in The British Medical Journal dated June 15, 1895. The portrait photograph originally appeared in the Thiersch biography Carl Thiersch ~ Sein Leben, written and published in 1922 by his son Justus.
Interestingly, this description seems to closely match the thin hardened “puddle” of balsam-like mountant seen surrounding and sealing the specimen covers on many of the Beck imports (Figs. 1, 4, 5). Unfortunately, neither Thiersch’s biography (written many years after his death by his son in 1922), nor my historical records search in Germany produced any mention of his involvement in a commercial relationship or business of any kind [39].

Confirmation of Thiersch as the maker of the Beck transparent injections was finally provided by the 15 June 1895 edition of The British Medical Journal. Included in an obituary for Thiersch [40] (Fig. 7), was the definitive statement:

_He was a most dexterous microscopist in the days when section cutting and staining were in their infancy, and we are informed that five-and-thirty years ago he was introduced to Messrs. Smith and Beck, of Cornhill, and supplied them for some years with marvelous slides of injected and stained specimens, both of healthy and diseased structures. Any of our readers who happen to possess these beautiful slides may like to know who was their author._

**In Conclusion**

Thiersch’s lasting contributions to scientific knowledge and medical practice were considerable [30, 31, 40]. He contributed to the understanding of wound healing and the importance of antiseptics, and was one of the first to demonstrate the epithelial origin of cancer. Some of his surgical procedures are still in use today, for example the Thiersch Graft.

Thiersch made the transparent injections sold by Beck in the early 1860s: his development of the techniques required arose from his work in anatomy, and are a lasting monument to this “German professor of surgery”.

**Acknowledgements**

I would like to express my appreciation to Brian Davidson for his support along the way. My sincere thanks also to Brian Bracegirdle, James McCormick, Brian Davidson, Brian Stevenson, and Peter Paisley for generously sharing information concerning examples of the Beck German imports in their collections, and to Katarzyna Szeremeta for research on my behalf in Germany.

John Jay College of Criminal Justice
City University of New York

Sexual Selection

- Typically: females have larger investment
  - leads to selective females
  - energy invested in offspring
  - males with secondary sexual characteristics
  - usually involves a trade-off
DUTIES OF A FORENSIC CHEMIST

- Analyze evidence submitted for presence/absence of controlled substance
- Assist law enforcement and prosecutors in case development and preparation
- Testify in court
- Provide field assistance to law enforcement

DILUENTS

Inositol

Birefringent, Rectangular Crystals with Oblique Angle of Extinction

MICROCRYSTALLINE TEST

Polarized Light Microscope ("PLM")
SMSI Awards Dinner to Honor
Dr. Wilfried Stoecklein

Inter/Micro 2016
An international microscopy conference.
June 6 - 10 at McCrone Research Institute, Chicago

Join Inter/Micro and the State Microscopical Society of Illinois (SMSI) on June 8 as they honor Wilfried Stoecklein with the 2016 August Köhler Award at the annual Inter/Micro awards dinner. The dinner will be held at Harry Caray’s Restaurant, 33 W. Kinzie Street in downtown Chicago.

Dr. Stoecklein has a distinguished career as a forensic science and materials analysis researcher with the Bundeskriminalamt (BKA) federal investigative police agency of Germany. His ideas were adopted by Zeiss for a new generation of microspectrophotometers that are still used today. Stoecklein helped found a central automotive paint collection in 1985, fulfilling his interest in building sample and data collections for the examination of paint and glass frequencies.

SMSI has conferred awards/honors to top microscopists since 1967. In 1995, SMSI began awarding bronze medallions to the recipients of the Society’s current August Köhler Award for outstanding contributions to light microscopy and Émile M. Chamot Award for outstanding work in one or more areas of chemical microscopy. Learn more about the 2016 SMSI Awards Dinner and register online.

Book Your Hotel Today -- Room Availability is Limited

Inter/Micro 2016

An international microscopy conference.
June 6 - 10 at McCrone Research Institute, Chicago

As the busy summer season approaches in Chicago, now is the time to reserve your hotel room for Inter/Micro 2016. The preferred hotels are the two Club Quarters locations in the downtown area. Click on the hotel name to reserve your room today:

Club Quarters, Central Loop
111 W. Adams Street
3 miles from McCrone

Club Quarters River Hotel, Wacker Drive at Michigan Avenue
75 E. Wacker Drive
4.5 miles from McCrone

To reserve a Club or Standard room for either location at McCrone's low member rates, including a $20 daily transportation voucher, please call +1 312-214-6400 and tell them that you are an Inter/Micro attendee. View other recommended hotels and register online for Inter/Micro 2016.
EAS & CoSMoS are teaming up to bring you the Method Development Olympics

Are you interested in a challenge? Would you enjoy designing experiments and competing against other state of the art laboratories developing an analytical method to characterize an unknown sample? If so, the EAS/CoSMoS Method Development Olympics (MDO) 2016 is the challenge for you! Judges will evaluate results based on accuracy and amount of ancillary information discovered as well as the creativity of the method development approach.

For an inside look please read a review of the 2015 event (How to Tackle an Unknown: Notes from the Fourth Method Development Olympics at CoSMoS)

How Does It Work?
Visit the CoSMoS website and, using the submission form, notify the organizing committee of your interest in participating. Participants will be provided a sample, defined objectives for the analytical challenge, as well as criteria to guide the method development process. Based on the submitted solutions, three finalists' methods will be selected by the EAS/CoSMoS MDO organizing committee for presentation based on creativity, uniqueness and accuracy of the approach. The top 3 finalists will be invited to present their work at EAS which will be held in Somerset, NJ November 14-16, 2016. The audience will vote to determine who is awarded the Bronze, Silver, and Gold Medals and associated honoraria.
Submission and Key Dates:
Sign up for participation - Deadline June 1
Samples sent to participants - August 1
Method results due to Committee for Finalist Selection - October 1
Finalists selected - October 15
Finalists presentations at EAS - November 14
Medals awarded at EAS - November 15

**Historical NYMS Bulletins For Sale**

The bulletins are limited in number and can be purchased, while they last, as a set of 8 Bulletins for $10.00/set plus mailing. Individual copies are $2.00/ea

The bulletins and other out-of-archive publications may be viewed at the NYMS Library in Montclair, New Jersey.

If interested in owning a part of NYMS history, please contact Mel Pollinger by email at pollingmel@optonline.net or simply pick up a set at the next NYMS meeting in Clifton, N.J.

Each set of NYMS Bulletins is comprised of the following:

Vol. 1 New York, N. Y., January, 1937 No.3
COLLECTING RECENT DIATOMS by JOSEPH F. BURKE

Vol. 1 New York, N. Y., February, 1937 No. 4
PREPARING RECENT DIATOMS By JOSEPH F. BURKE

Vol. 1 New York, N. Y., November, 1937 No.5
MOUNTING RECENT DIATOMS By JOSEPH F. BURKE

Vol. 3 New York, N. Y., June, 1951 No: 1
PREPARATION OF METAL FOR MICROSCOPICAL EXAMINATION
by F. Gordon Foster Fellow, New York Microscopical Society

Vol. 1 New York, N. Y., December, 1936 No.2
MAKING A ROCK SECTION
By GEORGE E. ASHBY

Vol. 1 New York, N. Y., February, 1936 No.1
THE MYCETOZOA
By ROBERT HAGELSTEIN

Vol. 2 New York, N. Y., April, 1944 No.1
THE HISTORY OF THE MICROSCOPE
By ROBERT HAGELSTEIN

Vol. 1 New York, N. Y., January, 1940 No.6
MOUNTING INSECTS BY THE PRESSURE METHOD
By Roy M. ALLEN

Directions to NYMS Headquarters

One Prospect Village Plaza
(66F Mount Prospect Avenue)
Clifton, NJ 07013

GPS: Intersection of Colfax & Mt. Prospect:
Latitude 40.8656 N, Longitude 74.1531W,
GPS: Our building: Latitude 40.8648 N,
Longitude 74.1540 W

From George Washington Bridge:
Take Interstate Route 80 west to Exit 57A, Route 19 South. Take Route 19 to Broad Street and continue two lights to Van Houten Avenue. Turn Left. Go to second light, Mount Prospect Avenue and turn left. Building 66F is on the left side, one and a half blocks from Van Houton.

From Lincoln Tunnel:
Follow exit road to NJ route three west. Continue to Bloomfield Avenue exit. Turn right to Circle and go three quarters to Allwood Road West. Mount Prospect Avenue is a few blocks on the right (a small street) Turn right and go to first light (Van Houton) continue. Building 66F is on the left side, one and a half blocks from Van Houton.

From North:
Take Garden state Parkway South to Route 46 Clifton Exit. On 46 Make second exit to Van Houton Ave. Continue to third light Mount Prospect Avenue and turn left. Building 66F is on the left side, one and a half blocks from Van Houten.

From Route 46 coming from west:
Take Broad Street Exit in Clifton and follow Directions above from GW Bridge.

From route 46 coming from East:
Take Paulson Avenue Exit in Clifton and follow to Second light, Clifton Ave turn right. Go to next light, Colfax, turn left, go three blocks and turn right on Mount Prospect Ave.. Building 66F is half block on right.

Public transportation from NY:
Take NJ Transit train from Penn Station to Secaucus Transfer Station. Change trains to Bergen Line to Clifton (call NJ Transit for schedules). From Clifton Station cross under tracks to first street and go left one block to Mount Prospect Street, turn right and Building 66F is one half block on Right.
